

Whose door do you knock on to fix the pump?

**A small developer is the building's first
long-term owner.**

One electric pump, inside one flat

In a design review for an 11-unit infill project near Lisbon, most of the rainwater and sewage ran to an electric pump, and the pump sat inside one of the flats.

That's a very bad decision.

The warranty is still ours

Within two or three years it becomes a maintenance issue. In Portugal, a developer selling to consumers answers for structural defects for ten years, and for other defects for five.

Simulate before you buy the premium kit

The energy rating often hinges on a heat pump or solar more than on premium kit, so run the simulation first and spend after.

If we try so hard and in the end we're a B anyway, what did we do?

Every building system gets two questions: where does it fail, and whose door do you knock on to fix it?

Take the two questions into your next design review, and tell me what I missed.
