

When information is free, where does the edge go?

**Halfway through a strategy meeting, I
admitted the pace of AI was overwhelming
me.**

suf Zen · Realization

Information isn't the currency anymore

When a system can research, compare and propose new directions by itself, the cost of creating new knowledge drops so low that it's not what matters.

Then a clearer thought arrived.

Stay at the frontier, keep your core elsewhere

AI multiplies what a small team can do, so be at the frontier. But keep the core of your work where technology has no capabilities: people, materials, buildings, streets.

The edge moves to where technology can't reach

What the tools do

Research

Compare and propose directions

Preparation

Get us to the table ready

What stays with us

Judgement

Which problems to point it at

Trust

Deals close face to face

Be at the frontier of the tools, and keep the core of your work in the physical world.

What stays scarce: judgement and trust

Judgement about which real problems to point the machines at, and values. In Portuguese property, deals still close on trust, face to face.

**How many apartments before a building?
Maybe hundreds.**

Use AI to prepare the decision, and keep the decision where the building is.

Tell me where the edge sits in your field,
especially if you see it differently.
