How do you value buildings you can't walk into?

One spreadsheet on day one would be false precision.

Shortlist from the desk first

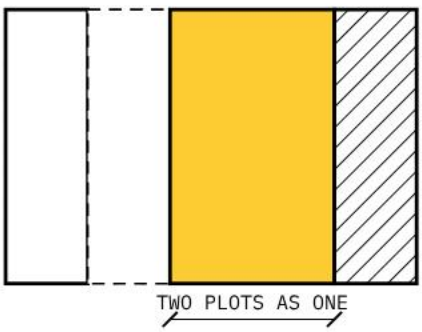

Some buildings are occupied, some have no floors or roofs, some have several heirs behind one door. Shortlist from desk research by potential, complexity and risk.

> **You can't enter half the buildings, so don't pretend.**

Label each building by its move

Go up, build on the empty plot, or merge plots and find more area. Then pay for proper valuations on a few representative typologies to anchor the rest.

Tag each building by its move before you price it

Go up
add floors on top

Empty plot
build on the empty plot

Merged plots
merge plots, find more area

Can't enter
desk research first

N

Three moves: go up, build on the empty plot, or merge plots. And some you can't enter.

Rank by quality, not by risk

Parcels with the fewest surprises are often too small to be worth the effort. The complicated prime block is where the uplift sits.

> **The investors challenged my ranking, and they were right.**

Before the first euro, agree two limits: what you'll spend learning and what you'll spend buying.

Weighing a portfolio like this? Send me a message and we'll talk it through.
